Smart Options | SyscomERP *smart*™

Overview

Smart Options are available to be added to Smart Core as your business grows and you require additional functionality.

Decoration

For those businesses that provide a service to take a standard product and add logo's or labels, this option provides the functionality to manage these steps. Built into the sales order entry screen, the operator can specify an image and its position on the garment for the process to be completed. The system supports the management of the embellishment to be completed either by an internal process or at an external supplier, with all of the necessary supporting documentation.

Man-packs

Where garments are sold in pre-arranged sets, the man-pack option is designed to give you complete control throughout the whole distribution process. Each item can be given its own individual size so that a dynamic option can be offered. Integrated into the sales process, a man-pack item can be tailored for each requirement so that the components can be picked and despatched to meet a customer's specific requirements.

Manufacturing

Smart Manufacturing is a fully integrated manufacturing system incorporating a rich range of functionality for managing garments at style, colour and size levels, or for individual SKU's. There is something for every type of operation. Full materials and labour tracking gives end to end visibility of production and costs to ensure you gain the maximum benefits.

EDI

Smart EDI is designed to accept incoming orders in a number of user defined file layouts. This provides a simple mechanism for businesses to trade electronically from a customer or web site for immediate improvement in service and performance.

Inter-Company Trading

This option manages inter-company trading between multiple businesses within a group. It eliminates the need for re-keying purchase and sales orders on each business, reducing errors and saving time.

Smart Options Overview

Warehouse Management

As bar code management is common in warehouses, **Smart Warehouse Management** has the functionality to track individual garments or complete bundles through the key stages of the pick and pack process.

Bar Code WIP tracking

As an addition to the manufacturing option, bar code tracking can be introduced at key operational stages so items can be traced within a Cut Make and Trim **CMT** plant.

PDA

The **Smart PDA** option is available for companies that require sales orders to be entered off site. Where the user has an internet connection and a mobile device then a fully functional order entry system is accessible. Orders can be taken real time, and up-to-date pricing and stock levels can be accessed remotely.

PDM

To assist in the management of the design process for any garments **Smart PDM** is available as an integrated solution. Based upon browser technology that allows for remote users, suppliers and designers to collaborate on new products. A major function is the inclusion of multiple materials libraries that can be used to research available options when designing to a price point.

PDM Critical Path

Smart Critical Path is a powerful tool to help manage and visualise progress towards target dates and includes a dynamic graphical scheduler that calculates, in real time, the critical path in a series of tasks that have to be completed. It determines the latest start date principle so that all available 'float time' can be utilised.

Wardrobe management

Smart Wardrobe Management allows you to offer a more comprehensive solution to your customer in regards to the management of their staff's uniform entitlement. Each employee can be recorded with their own wardrobe and with options of cash value or points based limits allowances. Any alternatives can be centrally managed so that the system provides a complete service to the client.

Web wardrobe

Smart Web Wardrobe compliments the **Smart Wardrobe Management** option and allows the end user wearer to manage their own orders online. A web based portal provides a simple employee interface showing the uniform item option they have available in their personal wardrobe and from here the individual can order up to the predefined item limits. This simplifies the whole order processing system, and is a powerful tool allowing the wearer to manage their own entitlement.

Web Inventory

As an extension to the **Smart Web Wardrobe** functionality, the client could wish to manage their own on site consignment stock. **Smart Web Inventory** controls this operation and will replenish from your main warehouse reducing your administration costs, whilst improving customer service.

eCommerce

SyscomERP smart has a recommended eCommerce solution that is fully integrated into the core application. This provides a simple and quick to implement solution that is designed to fit your business.

Retail

For an end to end solution **SyscomERP smart** is integrated to a global retail management system that caters for single or multi-store situations. This can be managed from a central control point using data sourced from within **SyscomERP smart**, items can be sent to the stores, and sales information can be reported upon at the head office.
